Internet Services Providers

Bynet
DATA COMMUNICATIONS LTD

radware
get certain

This gives Service Providers the flexibility to deliver their unique services with any security tools of **their choice**. In addition, CID's Bandwidth Management capabilities permit setting different bandwidth management policies per user's service. This allows ISPs to offer a wide variety of service offerings and have full control of the service level.

Infrastructure for Advanced SECURITY Services

As the importance of security network-based services arises, Radware and Bynet Data Communications introduce their solution with CID. The Content Inspection Director (CID) transparently detects and redirects users (based on RADIUS information) that subscribe to content inspection services such as parental control, IDP, Firewall or anti-virus scanning, in multi-Gigabit speed. The CID also guarantees the high availability and optimized performance of these content inspection devices. This allows Service Providers to offer content inspection services in carrier grade.

Thanks to the CID's transparency features, Bynet can integrate it with a variety anti-virus and web filtering vendors (e.g Trend Micro, Symantec, Network Associates, WebSense, SurfControl) as well as SSL terminators and network Firewalls.

Benefits:

- **Wide range of service offering** - Service Providers can now deliver value added content inspection services such as URL filtering, anti-virus protection, Intrusion Detection and even caching services to consumers and enterprises.
- **Carrier grade service** - CID's advanced Health Monitoring and load balancing capabilities guarantee high availability and optimal service delivery.
- **Minimal initial investment** - Transparent and cost effective scalability allows to start delivering the service with minimal investment and add more capacity as the need arises.
- **Full compatibility with any anti-virus** - Gives Service Providers the flexibility to deliver anti-virus service with any anti-virus vendor.
- **Different QoS per customer's service** - Allows ISPs to offer a wide variety of service offerings and have full control of the service level.
